Technical Skills

PHP / Laravel	Linux / Server Admin	Java / Android
Docker / DevOps	MySQL / PgSQL / SQLite	Git / CI-CD
AI Workflows		

Education

M.Sc. Computer Engineering—Software Payame Noor University (Tehran Shomal) — 2018–2021
B.Sc. Software Engineering K. N. Toosi University of Technology — 2013–2018

Professional Experience

EXPERIENCE

Founder & CEO — FardaDev	2023 — Present
A software agency from idea to execution—technical leadership of a development team building multiple enterprise products simultaneously. Personally set up the entire infrastructure from scratch to production. Admin Dashboard — The admin team dealt with hundreds of accounts, emails, and two-step verification codes with zero structure—no one knew who had access to what, when passwords changed, who last accessed which account, or who had access on a given day. I built a centralized dashboard that tracks all of this with full auditability. Incoming emails are routed into the database and automatically classified via regex into categories (notification, verification code, transaction, etc.). Every section has role-based, per-user access control, and all activity is auditable. Andro.law — Over 2,000 clients each needed contracts with varying terms and values—manual drafting and tracking at this scale was impossible. I designed a system where the client enters information, an official inquiry runs, an admin builds a template, and with a single click a Word/PDF document is generated with all values filled in—along with automated SMS delivery and digital signature in the dashboard. Support Platform — Admins were providing support directly through personal or work Telegram accounts—there was zero visibility into who said what to which client, and a single admin had to juggle Telegram, tickets, and several other places simultaneously. I built a platform that centralizes all channels into a single interface: live chat via a Telegram bot and a web panel with intelligent ticket routing. Admins now have one interface to manage, every exchanged message is visible and auditable, and since everything is logged, admin performance reporting is now available. Dedicated Infrastructure — For greater control and lower cost, I built the entire infrastructure from scratch on Hetzner bare-metal with Proxmox: installing Proxmox on raw servers, building Ubuntu and Windows templates with Cloud-Init, security hardening, firewall and network configuration. Today it serves 70+ VMs with 512GB RAM, 8TB storage, and 70+ dedicated IPs.	
Senior Developer — Mazraeh Nemouneh Gorgan Co.	2021 — 2023
Applied my skills during military service—designed and built farm management software from the ground up. Shift Planner — Multiple stations with dozens of guards—personnel data, payroll, leave, and daily scheduling were all done manually. I built a system where you define guards and shift types, and the system automatically arranges the weekly schedule. The final roster sheet is ready to print with a single click, and scheduling accuracy improved dramatically. (Still in use)	
Senior Developer — Sheena Advanced Tech Co.	2017 — 2021
Designed and developed digital health products within a small team. Cipsa Platform — Telemedicine website with appointment scheduling, payment, and real-time notifications Monks App — Android health kiosks capturing vital signs and transmitting data to physicians	
Early Career — Web, SEO, and Android Development	2013 — 2017
ReleFilm — Specialized SEO focused on content originality and longevity—most posts reached Google's first page KNTU App — Graphic and visual design for a university introduction app FollowerPlus Redesign — A project with amateur code, constant bugs, frequent DB timeouts, and hacker intrusions was referred to me. In the first week, I put in ~80 hours fixing the core issues—first rewrote the backend without service interruption, then took over the app and continued development and maintenance for 3 years. (100K users)	

Open Source

OPEN SOURCE

ez-docker-for-laravel

Free alternative to paid services like Laravel Forge; full Nginx and MySQL management, built-in CI/CD, support for multiple environments with dedicated Dockerfiles, and a CLI that automates most configuration by reading your .env file.

github.com/MansourM/ez-docker-for-laravel

telegram-objects-php

Framework-agnostic typed library for the Telegram Bot API. Unlike common libraries full of magic methods and unstructured arrays, this project uses typed DTOs with full validation, enabling static analysis and IDE intellisense.

github.com/MansourM/telegram-objects-php

saman-banking-api-php

Laravel package with DTO-based architecture and a strong API for the Saman Bank payment gateway; designed with emphasis on type-safety and eliminating magic.
